S 004

THE CALCULATION OF THE POSITIONS AND VELOCITIES
OF THE EARTH DURING THE HIPPARCOS MISSION

Jean CHAPRONT

Gérard FRANCOU

Bruno MORANDO

*Ce document a été publié par les soins du consortium "FAST"
du projet HIPPARCOS.*

*Service des Calculs et de Mécanique Céleste du Bureau des Longitudes
ERA 808
77, avenue Denfert-Rochereau
75014 Paris.*

During the HIPPARCOS mission, corrections to the apparent positions of the stars, as observed by the satellite, will have to be taken into account to allow for parallax and aberration corrections.

Let the barycenter G of the Solar System be the origin of a reference system as close as possible to an inertial system. If T is the center of the Earth and S the satellite, we have :

$$\vec{GS} = \vec{GT} + \vec{TS}$$

and,

$$\dot{\vec{GS}} = \dot{\vec{GT}} + \dot{\vec{TS}}$$

The second vectors of the right hand members of the above equations are the position and the velocity of the satellite with respect to the center of the Earth; it is supposed that they will be measured whenever wanted with a sufficient accuracy.

We need the first vectors of the right hand members of the equations; these vectors are the position and the velocity of the Earth with respect to the barycenter of the Solar System.

NEEDED ACCURACY.

Let X_G , Y_G , Z_G be the components of the position vector of the Earth \vec{GT} with respect to the barycenter of the Solar System, \dot{X}_G , \dot{Y}_G , \dot{Z}_G the components of the velocity of the Earth $\dot{\vec{GT}}$ with respect to the same point.

It will be assumed that the reductions of the observations of HIPPARCOS will have to be made to a precision of 10^{-4} arcsecond.

The highest star parallax is roughly equal to one arcsecond; to ensure a precision of 10^{-4} arcsecond, the Earth-barycenter distance $\|\vec{GT}\|$ has to be measured with the same relative precision which corresponds to 10^{-4} astronomical unit, or 15 000 km. In fact, a much higher precision can be attained easily and, as will be seen, the formulae which will be given ensure a precision 1000 times greater.

Again, as far as the aberration corrections are concerned, the precision to be attained is 10^{-4} arcsecond. The main part of the aberration corrections is of the order of $\|\dot{GS}\|/c$, where c is the velocity of light. As the velocity of the satellite with respect to the Earth $\|\dot{TS}\|$ is supposed to be known with a sufficient accuracy, we are concerned here with the precision needed on the velocity of the Earth with respect to the barycenter of the Solar System $v = \|\dot{GT}\|$. To reach a precision of 10^{-4} arcsecond upon v/c , one needs to know v within an accuracy of 15 cm/s. A precision of 5 cm/s has been retained.

SOURCES AVAILABLE.

There are two up to date theories of the motions of the Sun and planets which can be used for our purpose :

DE 200, which is the result of a numerical integration carried out at the Jet Propulsion Laboratory (Standish and Williams, 1982). This ephemeris covers the years 1800 to 2050; it is related to an equinox and equator J2000.0 close to those defined by FK5.

Ephémérides BDL 82 of the Bureau des Longitudes. These ephemerides use the planetary theories VSOP82 and TOP82 (Bretagnon, 1982), (Simon, 1983) and the lunar theory ELP2000-82 (Chapront-Touzé and Chapront, 1983) which are analytical or semi-analytical. The constants of integration have been determined by adjustment to DE200. These theories upon which the ephemerides BDL82 are built, are referred to a dynamical ecliptic and equinox; a rotation matrix allows to refer the ephemerides to the FK5 system.

In the case of the Earth, angular differences obtained in the positions using DE200 or BDL82 never exceed 0.007 arcsecond, which corresponds to 5 km (Francou et al., 1983). In BDL82, the IAU System of astronomical constants has been used all through.

As far as the velocity is concerned, Table I shows, for a certain number of dates, the corresponding values of v/c in arcsecond, where v is the velocity of the Earth with respect to the barycenter of the Solar System calculated from BDL82. D , in the last column, is the difference expressed in 10^{-6} arcsecond between the value of v/c listed and the value obtained from DE200. This difference has been evaluated in the FK5 system.

It can be seen that this difference never exceeds $3 \cdot 10^{-6}$ arcsecond (or, 0.5 cm/s on the velocity), which is well within the accuracy limit we have chosen.

In the forthcoming formulae, we have taken the ephemerides BDL82 as a source.

REPRESENTATION OF THE EPHEMERIS.

BDL82 represents the ephemerides using developments into Chebyshev polynomials for given intervals of time. Although this procedure saves room, we have adopted here a still more compact representation of the position vector and velocity of the Earth for the required precision. We describe below the adopted formulation of this new type of approximation.

We have kept the same notations as before and introduce the Earth-Moon barycenter denoted by Γ (capital gamma). We have :

$$\begin{aligned} \vec{GT} &= \vec{G}\Gamma + \vec{\Gamma}\dot{T} \\ \text{and,} \quad \dot{\vec{GT}} &= \dot{\vec{G}\Gamma} + \dot{\vec{\Gamma}\dot{T}} \end{aligned} \tag{1}$$

This writing splits in two parts the short periodic terms due to lunar action through the vectors $\vec{\Gamma}\dot{T}$ and $\dot{\vec{\Gamma}\dot{T}}$, and the annual terms through the vectors $\vec{G}\Gamma$ and $\dot{\vec{G}\Gamma}$.

The components X_T , Y_T , Z_T of \vec{GT} and \dot{X}_T , \dot{Y}_T , \dot{Z}_T of $\dot{\vec{GT}}$ are represented by the following Fourier series :

$$\begin{aligned} X_T &= \sum_{i=1}^{22} A_i \cos(n_i t + \phi_i) \\ Y_T &= \sum_{i=1}^{22} A_i' \sin(n_i t + \phi_i) \\ Z_T &= \sum_{j=1}^8 B_j \sin(m_j t + \psi_j) \\ \dot{X}_T &= \sum_{i=1}^{22} -A_i' \sin(n_i t + \phi_i) \\ \dot{Y}_T &= \sum_{i=1}^{22} A_i' \cos(n_i t + \phi_i) \\ \dot{Z}_T &= \sum_{j=1}^8 B_j' \cos(m_j t + \psi_j) \end{aligned} \tag{2}$$

These formulae are valid from 1900 to 2000. The quantities A_i , A'_i , B_j , B'_j , n_i , m_j , ϕ_i and ψ_j are given in Table 2.

The components X , Y , Z of \vec{GT} and \dot{X} , \dot{Y} , \dot{Z} of \vec{GT} are represented by a sequence of approximating functions defined upon time intervals of 400 days covering 1980 to 2000. The approximating functions are written as follows :

$$\begin{aligned} & a_0 + a'_0 t \\ & + a_1 \sin(Nt + b_1) + a'_1 t \sin(Nt + b'_1) \\ & + a_2 \sin(2Nt + b_2) + a'_2 t \sin(2Nt + b'_2) \\ & + a_3 \sin(3Nt + b_3) \\ & + a_4 \sin(4Nt + b_4). \end{aligned} \tag{3}$$

The quantities a_0 , a'_0 , a_1 , b_1 , a'_1 , b'_1 , ... are listed in table 3, for each interval.

Remark. The above formula (3) must be strictly used for dates which belong to its interval of definition.

In formulae (2) and (3), the time t is measured in julian years from J2000.0 (2451545.0). The coefficients A_i , A'_i , B_j , B'_j , a_n and a'_n are expressed in kilometers. Frequencies ϕ_i , ψ_j and N are in radians per year; in particular,

$$N = 2\pi \text{ rad/year.}$$

Phases ϕ_i , ψ_j , b_n and b'_n are in radians.

SPECIFICATIONS OF THE COMPUTATIONS.

Positions and velocities of the Earth with respect to the barycenter of the Solar System are computed using formulae (1), (2) and (3).

The components X_G , Y_G , Z_G of \vec{GT} are measured in kilometers. The components \dot{X}_G , \dot{Y}_G , \dot{Z}_G of \vec{GT} are measured in kilometers per second.

A comparison between the source BDL82 and the results obtained with formulae (2) and (3) allows us to guarantee an accuracy of 10 km for the positions and 5 cm/s for the velocities.

The computed components are ecliptic coordinates referred to the equinox of the fundamental catalogue FK5 for J2000.0 (2 451 545.0).

The time scale is Terrestrial Dynamical Time (TDT). The time is expressed in julian years from J2000.0. For a given julian date JD , one has :

$$t = (JD - 2 451 545.0) / 365.25$$

EXAMPLE OF USE OF THE TABLES.

Compute the position and velocity of the Earth with respect to the barycenter of the Solar System for the date : Feb. 5 1988 0^h (TDT) in the fixed ecliptic frame for J2000.0.

This date corresponds to the julian date :

$$JD = 2 447 196.5$$

All the computations have been performed with a pocket computer with 10 digits.

The time t , expressed in julian years and reckoned from J2000.0, is :

$$t = (JD - 2 451 545.0) / 365.25 = - 11.905 544 15$$

Introducing this value of t , the series of Table 2 give for the components of the vectors \vec{r}_T (X_T , Y_T , Z_T) and $\dot{\vec{r}}_T$ (\dot{X}_T , \dot{Y}_T , \dot{Z}_T) :

$$X_T = - 105 877 923$$

$$\dot{X}_T = - 21.336 566$$

$$Y_T = + 103 632 152$$

$$\dot{Y}_T = - 21.392 455$$

$$Z_T = + 4 543$$

$$\dot{Z}_T = - 0.000 629$$

In Table 3, to compute the vectors \vec{r}_T (X , Y , Z) and $\dot{\vec{r}}_T$ (\dot{X} , \dot{Y} , \dot{Z}), one searches for the interval covering the date JD , i.e., the interval from Sept. 1 1987 (2 447 040.0) to Oct. 5 1988 (2 447 440.0). One gets :

$$X = + 4 584$$

$$\dot{X} = + 0.004 182$$

$$Y = - 1 800$$

$$\dot{Y} = + 0.010 985$$

$$Z = - 116$$

$$\dot{Z} = + 0.001 031$$

Finally, with $\vec{G}\vec{T} = \vec{G}\vec{T} + \vec{r}_T$ and $\dot{\vec{G}\vec{T}} = \dot{\vec{G}\vec{T}} + \dot{\vec{r}}_T$, one obtains the following results for the components of the vectors $\vec{G}\vec{T}$ (X_G , Y_G , Z_G) and $\dot{\vec{G}\vec{T}}$ (\dot{X}_G , \dot{Y}_G , \dot{Z}_G) :

$$\dot{X}_G = - 105\,873\,339$$

$$\dot{Y}_G = + 103\,630\,352$$

$$\dot{Z}_G = \quad \quad \quad 4\,427$$

$$\dot{X}_G = - 21.332\,384$$

$$\dot{Y}_G = - 21.381\,470 \quad (C_1)$$

$$\dot{Z}_G = + 0.000\,402$$

These results have to be brought together with the direct computations from the source BDL82 of the components of the vector \dot{GT} listed in Table 1. For the date JD , one reproduces below the \dot{GT} components :

$$\dot{X}_G = - 21.332\,381$$

$$\dot{Y}_G = - 21.381\,454$$

$$\dot{Z}_G = + 0.000\,406$$

(C₂)

Differences between (C₁) and (C₂) are always smaller than 5 cm/s.

POSITIONS AND VELOCITIES OF THE EARTH WITH RESPECT
TO THE EARTH-MOON BARYCENTER.

CALCUL DES POSITIONS ET DES VITESSES DE LA TERRE PAR RAPPORT AU BARYCENTRE DU
SYSTEME TERRE-LUNE.

SOURCE

SERIES DE FOURIER ETABLIES A PARTIR DES THEORIES DU BUREAU DES LONGITUDES :
THEORIE PLANETAIRE VSOP82 (P.BRETAGNON), THEORIE DE LA LUNE ELP2000-82 (M. ET J.
CHAPRONT).
LES COMPOSANTES DES VECTEURS POSITIONS ET VITESSES DE LA TERRE PAR RAPPORT AU
BARYCENTRE DU SYSTEME TERRE-LUNE SONT DES COORDONNEES RECTANGULAIRES ECLIPTIQUES
RAPPORTERES A L'EQUINOXE DEFINI PAR LE CATALOGUE FONDAMENTAL FK5 EN J2000.0
(DJ 2451545.0).

NOTATIONS

GAMMA : BARYCENTRE DU SYSTEME TERRE-LUNE.
T : CENTRE DE LA TERRE.
XT YT ZT : COMPOSANTES DU VECTEUR POSITION GAMMA-T (KM).
XPT YPT ZPT : COMPOSANTES DU VECTEUR VITESSE GAMMA-T (KM/S).
A(I) : COEFFICIENTS POUR XT ET YT (KM).
AP(I) : COEFFICIENTS POUR XPT ET YPT (KM/S).
B(J) : COEFFICIENTS POUR ZT (KM).
BP(J) : COEFFICIENTS POUR ZPT (KM/S).
N(I) : VITESSES ANGULAIRES POUR XT, YT, XPT ET YPT (RADIAN/AN).
PHI(I) : PHASES POUR XT, YT, XPT ET YPT (RADIAN).
M(J) : VITESSES ANGULAIRES POUR ZT ET ZPT (RADIAN/AN).
PSI(J) : PHASES POUR ZT ET ZPT (RADIAN).

UTILISATION

XT = SOMME(I = 1 A 22) : A(I) * COS (N(I)*T + PHI(I))
YT = SOMME(I = 1 A 22) : A(I) * SIN (N(I)*T + PHI(I))
ZT = SOMME(J = 1 A 8) : B(J) * SIN (M(J)*T + PSI(J))
XPT = SOMME(I = 1 A 22) : -AP(I) * SIN (N(I)*T + PHI(I))
YPT = SOMME(I = 1 A 22) : AP(I) * COS (N(I)*T + PHI(I))
ZPT = SOMME(J = 1 A 8) : BP(J) * COS (M(J)*T + PSI(J))
T EST COMPTE EN ANNEES JULIENNES A PARTIR DE J2000.0 (DJ 2451545.0).
ECHELLE DE TEMPS : TEMPS DYNAMIQUE TERRESTRE (TDT).
